

Step 1: Import necessary Python libraries.

```
In [1]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

Step 2: Load the dataset into a DataFrame.

```
In [2]: # Read the csv file using pandas read_csv
restaurent_df = pd.read_csv(r"Dataset .csv")
restaurent_df
```

Out[2]:

```

- **Checking Shape**

In [9]: `restaurent_df.shape`

Out[9]: (9551, 21)

Task 1: Top Cuisines

- ****Determine the top three most**

common cuisines in the dataset.**

```
In [10]: # Count the occurrences of each cuisine - value_count()
# used to reset the index of a DataFrame - reset_index()
value_counts = restaurant_df["Cuisines"].value_counts().reset_index().head(3)
value_counts
```

```
Out[10]:
```

	Cuisines	count
0	North Indian	936
1	North Indian, Chinese	511
2	Chinese	354

```
In [11]: plt.figure(figsize=(10,5))
values = value_counts['Cuisines']
labels = value_counts['count']
plt.bar(values,labels)
plt.title('Top three Cuisines')
plt.xlabel('Cuisines')
plt.ylabel("Count - Frequency")
plt.show()
```

- Calculate the percentage of restaurants that serve each of the top cuisines

```
In [12]: # adding new column 'Percentage' and calculate the percentage of restaurants that serve each cuisine
value_counts['Percentage'] = round((value_counts['count'] / len(restaurant_df))*100,2)
value_counts
```

```
Out[12]:
```

	Cuisines	count	Percentage
0	North Indian	936	9.80
1	North Indian, Chinese	511	5.35
2	Chinese	354	3.71

```
In [13]: plt.title('Percentage of restauranttrants that serve each of the top cuisines.')
plt.pie(value_counts['Percentage'],labels=value_counts['Cuisines'],autopct='%0.2f%%',startangle=90)
```

```
plt.show()
```

Percentage of restauranttrants that serve each of the top cuisines.

Task 2: City Analysis

- ****Identify the city with the highest number**

of restaurants in the dataset.**

```
In [14]: city_restaurant_count = restaurent_df.groupby('City')['Restaurant Name'].count()

# Find the city with the highest number of restaurants
max_restaurant_city = city_restaurant_count.idxmax()
max_restaurant_count = city_restaurant_count.max()
print(f"{max_restaurant_city} has highest number of restaurants, the count of restaurants is
```

New Delhi has highest number of restaurants, the count of restaurants is 5473 restaurants.

- **Calculate the average rating for restaurants in each city.**

```
In [15]: avg_ratings_by_city = restaurent_df.groupby("City")["Aggregate rating"].mean().reset_index()
avg_ratings_by_city
```

Out[15]:

	City	Aggregate rating
0	Abu Dhabi	4.300000
1	Agra	3.965000
2	Ahmedabad	4.161905
3	Albany	3.555000
4	Allahabad	3.395000
...
136	Weirton	3.900000
137	Wellington City	4.250000
138	Winchester Bay	3.200000
139	Yorkton	3.300000
140	istanbul	4.292857

141 rows × 2 columns

- **Determine the city with the highest average rating**

```
In [16]: avg_ratings = restaurent_df.groupby("City")["Aggregate rating"].mean().reset_index()
avg_ratings = avg_ratings.sort_values(by="Aggregate rating",ascending=False)
print("City with the highest average rating")
avg_ratings.head(1)
```

City with the highest average rating

Out[16]:

	City	Aggregate rating
56	Inner City	4.9

Observations

- City with the highest average rating
- **Inner** City with **4.9** as Avg Rating

Task 3 : Price Range Distribution

- **Create a histogram or bar chart to visualize the distribution of price ranges among the restaurants.**

```
In [17]: price_counts = restaurent_df['Price range'].value_counts()
plt.figure(figsize=(10, 5))
plt.bar(price_counts.index, price_counts.values, color=['red', 'blue', 'orange','yellow'])
plt.xlabel('Price Range')
plt.ylabel('Number of Restaurants')
plt.title('Distribution of Price Ranges Among Restaurants')
plt.show()
```

Observations

- Distribution of price ranges among the restaurants
 - 1
 - 2
 - 3
 - 4
- Calculate the percentage of restaurants in each price range category.

```
In [18]: value_counts = restaurent_df["Price range"].value_counts().reset_index()

# Rename the columns
value_counts.columns = ['Price-Range', 'Count']
total_count = value_counts['Count'].sum()

value_counts['Percentage'] = round((value_counts['Count'] / total_count)*100,2)

# Print the result as a table
df = pd.DataFrame(value_counts)
df
```

```
Out[18]:
```

	Price-Range	Count	Percentage
0	1	4444	46.53
1	2	3113	32.59
2	3	1408	14.74
3	4	586	6.14

Observations

- Percentage of restaurants in each price range category.

- Price Range :1 Percentage : 46.53%
- Price Range :2 Percentage: 32.59%
- Price Range :3 Percentage: 14.74%
- Price Range: 4 Percentage: 6.14%

Task 4: Online Delivery

- **Determine the percentage of restaurants that offer online delivery**

```
In [19]: total_restaurant_count =restaurant_df.shape[0]
online_restaurant_count = restaurant_df[restaurant_df['Has Online delivery']=='Yes']
online_restaurant_count= online_restaurant_count.shape[0]

# percentage of online order taken by the restaurants
percentage=round((online_restaurant_count/total_restaurant_count)*100,2)
print("percentage of online order taken by the restaurants")
print(percentage)
```

percentage of online order taken by the restaurants
25.66

Observations

- Percentage of restaurants that offer online delivery - 25.66%
- **Compare the average ratings of restaurants with and without online delivery.**

```
In [20]: # average rating of restaurant with and without online delivery
print("average rating of restaurant with and without online delivery")
restaurant_df.groupby('Has Online delivery')['Aggregate rating'].mean().round(2).reset_index()
```

average rating of restaurant with and without online delivery

```
Out[20]:
```

	Has Online delivery	Aggregate rating
0	No	2.47
1	Yes	3.25

Observations

- average ratings of restaurants with and without online delivery
 - No - Online Delivery - Avg Rating - 2.47
 - Online Delivery - Avg Rating - 3.25
